**IP Address**

---

If you want to connect to another computer, transfer files to or from another computer, or send an e-mail message, you first need to know where the other computer is. In other words you need the other computer's "address". An IP (Internet Protocol) address is an identifier for a particular machine on a particular network. It is part of a scheme to identify computers on the Internet.

An IP address is therefore

A unique identifier Towards Cyber Security that identifies machine on a network.

Device used by routers, to select best path from source to destination, across networks and internetworks. (A router is a device or, in some cases, software in a computer, that determines the next network point to which a [packet](#) Towards Cyber Security should be forwarded toward its destination)

Logical address, assigned in software by network administrator.

Types of IP address

Static address

Dynamic address

**Static IP address**

Manually input by network administrator.  
Towards Cyber Security  
Manageable for small networks

---

Requires careful checks to avoid duplication.

A static IP address is a number that is assigned to a computer by an Internet service provider ([ISP](#)) to be its permanent address on Towards Cyber Security the Internet. Computers use IP addresses to locate and talk to each other on the Internet, much the same way people use phone numbers to locate and talk to one another on the telephone. As name says, once the address is provided it cannot be changed.

It would be simple if every computer that connects to the Internet could have its own static IP number, but due to enormous growth of internet and growing need of IP Towards Cyber Security addresses many Internet service providers limit the number of static IP addresses they allocate, and economize on the remaining number of IP addresses they possess by temporarily assigning an IP address to a requesting Dynamic Host Configuration Protocol ([DHCP](#)) computer from a pool of IP addresses. The Towards Cyber Security temporary IP address is called a dynamic IP address.

### **Dynamic IP address**

Assigned by server Towards Cyber Security when host boots

Towards Cyber Security

Derived automatically from a range of addresses

Duration of 'lease' negotiated, then address released back to server.

Examples - BOOTP, DHCP

---

Static IP addressing is for one customer on one IP address and Dynamic IP addressing assigns a different IP address each time the Towards Cyber Security ISP customer logs on to their computer, Towards Cyber Security but this is dependent upon the Internet Service Provider (ISP) because some ISP's only change the IP address as they deem it necessary.

The biggest advantages of Dynamic IP Addressing are less security risk as the computer is assigned a new IP address each time the customer logs on, they are cost effective and there is automatic network configuration. Dynamic IP addressing should not be used for VOIP, VPN(virtual private network) playing online games or game hosting because Dynamic IP addressing is less reliable than Static IP addressing and could cause the service to disconnect while you are on Towards Cyber Security a VOIP, VPN or gaming.

## IP STRUCTURE

Currently the most common form of IP Address is IPv4 which uses 32 bits to store an address. Towards Cyber Security This means that there are theoretically  $2^{32} = 4,294,976,296$  different IP Addresses that can exist. IP addresses are [binary numbers](#), Towards Cyber Security but they are usually stored in text files and displayed in [human-readable](#) notations, such as 172.16.254.1 Towards Cyber Security (for IPv4).

A 32-bit binary number usually represented as 4 decimal numbers (sections) separated by a dot.

Each section is 8 bits (octet) long.

Each section can range from 0 to 255 ( $2^8 = 256$ , hence 0 - 255)

Written, for example, 128.35.0.72.

nnn.nnn.nnn.nnn Towards Cyber Security e.g. 192.168.7.1.

---

Some portion of the IP address represents Towards Cyber Security the network number or address and some portion represents the local machine address (also Towards Cyber Security known as the *host number* or address). IP addresses can be one of several classes, each determining how many bits represents the network number and how many represent the host number. The network portion Towards Cyber Security of the IP address is allocated under authority of the Internet Assigned Numbers Authority (IANA)/ American Registry of Internet work Numbers (ARIN)

Network administrators then assign the host portion of the IP address to the machines on the networks that they operate
